Solar installations on remote islands

Remote islands in the Pacific relied on diesel fuel for operating power generators.

Recent price increases and irregular visits to the islands resulted in an intermittent diesel supply. Solar power systems have been grant funded by the EU to improve the living conditions on those islands.

The systems with a cumulative capacity of 45kW_{peak} were installed under the supervision of Power Solutions staff over a period of four months.

Power Solutions staff provided training to participants on stand-alone solar PV AC systems prior to the installations.
